Certificate Program in Company Valuations

Objectives:

- Understanding the different methods of valuation - Discounted Cash Flow Valuation (DCF), Asset Based Valuation and Relative Valuation.
- DCF valuation will provide insights on how the present value of a company is calculated based on the expected future cash flows that the assets of the company can earn.
- Asset Based approach to business valuation would consider the underlying business assets in order to estimate the value of the overall business enterprise. This methodology would essentially estimate the cost of replacing the tangible assets of business and is useful in case of liquidation/closure of the business.
- Relative valuation will cover two key methods - Transaction method and multiples method. Transaction method would analyze all the transactions that have taken place in the industry in the recent past and map the average value of all the transactions to derive the value of the company. Multiples method would analyze key multiples to derive the value of the company. Key multiples include Price / Book value, Price / Earnings, Price / EBITDA and Price / Sales, etc.
